

SiteGent PRD and Product Overview

Version: Pilot overview

Live app: <https://sitegent.vercel.app>

Audience: contractors, testers, partners, potential investors, and collaborators

Executive Summary

SiteGent is a WhatsApp-first AI operations app for South African contractors. It helps a contractor turn a messy customer WhatsApp job message into an editable job card, quote draft, invoice draft, follow-up message, and saved company-private job record.

The product is intentionally not a heavy CRM. The core workflow is:

```
Create account -> add company details -> add prices -> paste WhatsApp message -> generate quote -> review/edit quote -> save job -> export quote/invoice
```

SiteGent is built for contractors and admin people who already run work through WhatsApp and need faster quoting without changing how they receive customer requests.

Product Positioning

One-line Description

SiteGent helps contractors turn WhatsApp job requests into editable job cards, quotes, invoices, and customer replies in minutes.

Short Pitch

Contractors receive work in messy WhatsApp messages. SiteGent reads the message, extracts job details, uses the contractor's own price list, prepares a quote draft, creates a job card, and saves the work privately to that company. The contractor remains in control and reviews every price before sending anything to a customer.

What SiteGent Is Not

SiteGent is not a full accounting system, payroll tool, enterprise CRM, or final pricing authority. It creates a practical draft that the contractor must review.

Target Users

Primary users:

- Small and medium South African contractors
- Trades business owners
- Admin staff who handle quotes
- Estimators

- Owner-run service businesses

Early pilot categories:

- Sand, stone, and material delivery businesses
- Plumbers
- Electricians
- Builders
- Maintenance teams
- Handymen
- Local service and delivery operators

Problem

Many contractors run day-to-day work from WhatsApp. A customer message often contains incomplete job details, rough quantities, location, urgency, and a phone number in one messy paragraph.

The contractor then has to:

- Understand the job
- Identify materials and labour
- Work out a quote
- Remember company prices
- Reply professionally
- Save the job
- Create an invoice later

This admin work is slow, repetitive, and easy to lose in WhatsApp chats.

Product Goal

For the 15-user pilot, the goal is simple:

Help a contractor quote faster while keeping human review, company pricing, and private saved jobs.

Success does not mean full automation. Success means the contractor can produce a useful first quote draft faster than doing it manually.

Core User Journey

1. User opens SiteGent.
2. User creates an account or signs in.
3. User creates a company profile.
4. User adds common company prices.
5. User pastes a WhatsApp job message.

6. SiteGent extracts customer, location, urgency, materials, and job summary.
7. SiteGent creates editable quote lines.
8. Quote lines show confidence:
 - Green: matched company price
 - Yellow: estimated price
 - Red: needs review
9. User edits quantities and prices.
10. User saves the job.
11. SiteGent saves customer, job, message, quote, quote items, invoice, and AI review record.
12. User exports a quote or invoice.
13. User sends the final reviewed document or message to the customer.

Live App Screens

First Screen: Quote Page

The first screen focuses on the main action: paste a WhatsApp message and generate a quote draft.

Account and Signup

Users can create a SiteGent account with simple contractor-friendly labels: name, phone, email, password, company name, and business address.

WORKSPACE

Account signup screen

Prices Page

The Prices page is where a company adds its own charges. This is important because quotes should be based on the contractor's real rates, not generic AI guesses.

Prices page

Mobile View

The mobile layout is important because many contractors will open the app from phones while working from WhatsApp.

Saved Jobs

The Jobs page shows saved work for the signed-in company. Jobs are private to the company workspace.

Invoices

The Invoices page shows invoice drafts created from saved jobs. Users can export invoices and manage simple payment state.

Company Profile Setup

If a signed-in user still needs company setup, SiteGent asks for the minimum information needed to create a private company workspace.

Feature Overview

1. WhatsApp Message Intake

The user pastes a customer message or voice-note transcript. SiteGent is optimized for unstructured messages that mention customer needs, location, dates, quantities, materials, and phone numbers.

2. AI Job Extraction

The AI extraction endpoint turns the message into structured job data:

- Customer name
- Phone number
- Location
- Job type
- Urgency
- Estimated date
- Materials

- Missing details
- Job summary
- Quote line suggestions
- Follow-up message

Production security requires a signed-in user with a company before OpenAI is called.

3. Company Price List

Each company can add its own price items. A price item can include:

- Name
- Category
- Unit
- Unit price
- VAT rate
- Aliases
- Notes

Aliases help SiteGent match customer wording to company pricing. For example, "river sand", "sand", and "cubes river sand" can point to the same item.

4. Quote Confidence Labels

Quote lines communicate pricing trust clearly:

- Matched company price: exact match from the company price list
- Estimated price: AI or manual estimate
- Needs review: missing or unreliable price information

The goal is not to hide uncertainty. The goal is to help the contractor know what to check first.

5. Editable Quote Draft

Users can edit descriptions, quantities, unit prices, and line totals before saving. Totals and VAT are recomputed server-side before saving.

6. VAT Settings

Company VAT settings support South African contractor needs:

- VAT registered: yes/no
- VAT percentage defaults to 15%
- If not VAT registered, VAT is not charged
- If VAT registered, configured VAT is shown in quote and invoice totals

7. Transaction-safe Save

Saving an operations pack creates multiple records:

- Customer
- Job

- Original message
- Quote
- Quote items
- Invoice
- AI review task

The save flow uses a Supabase RPC/database transaction so all records save together or none save. This protects against partial saved jobs.

8. Saved Jobs

Saved jobs are company-scoped. A user from another company should not see another company's jobs.

9. Quote and Invoice Export

Saved quotes and invoices can be exported through server-side document routes. Exported documents are intended to be reviewed before being sent to customers.

10. Pilot Feedback and Analytics

The app includes lightweight pilot feedback and usage signals. These are for learning during the 5-to-15 user pilot and should not become a heavy admin dashboard in the contractor workflow.

Technical Overview

Stack

- Next.js App Router
- React
- TypeScript
- Supabase Auth
- Supabase Postgres
- Supabase Row Level Security
- OpenAI
- Vercel

Main API Areas

- `/api/auth/signup`
- `/api/auth/signin`
- `/api/auth/me`
- `/api/auth/onboard`
- `/api/pricing`
- `/api/ai/extract`
- `/api/operations/save`
- `/api/saved-jobs`
- `/api/invoices`

- `/api/documents/quote`
- `/api/documents/invoice`
- `/api/feedback`
- `/api/analytics`
- `/api/health`
- `/api/readiness`

Database Model

Core tables include:

- `companies`
- `users`
- `customers`
- `jobs`
- `quotes`
- `quote_items`
- `price_items`
- `invoices`
- `messages`
- `payments`
- `ai_tasks`
- `ai_extraction_usage`
- `observability_events`

Privacy and Security

Production readiness includes:

- Supabase authentication
- Company-scoped data
- Row Level Security enabled on core tables
- Saved jobs private per company
- Server-side OpenAI key
- AI extraction blocked for anonymous users
- Per-user and per-company AI extraction quota support
- Server-generated quote and invoice numbers
- Transaction-safe save flow

Current Readiness

Production checks have passed for:

- Signup flow
- Signin flow

- Company onboarding
- Price-list import
- Quote generation
- Job save
- Quote export
- Invoice export
- VAT handling
- Tenant isolation
- Server-generated quote numbers
- Server-generated invoice numbers
- Anonymous AI extraction blocked
- Feedback events
- Pilot funnel signals

Known Manual Review Notes

During screenshot capture, a browser-based temporary profile setup action appeared to hang in the automation session. Existing automated production checks still passed for onboarding. This should be manually checked with a fresh human browser session before sending the app to all 15 testers.

Other items to review manually:

- Email confirmation behavior in Supabase
- Whether first-time contractors understand the Prices page
- Whether quote exports look professional enough for real customers
- Whether invoice exports match local business expectations
- Whether long WhatsApp messages remain readable on mobile

What Is Not Built Yet

Not yet in scope for the pilot:

- Full CRM
- Accounting integration
- Payroll
- Stock management
- Online card payments
- Team roles and permissions beyond the current owner-style flow
- WhatsApp Business API automation
- Customer portal
- Advanced scheduling
- Full admin console

These should not be built until the first 5-to-15 testers prove the quote workflow is valuable.

Pilot Plan

First 5 Testers

Goal: confirm that users can complete the core flow without hand-holding.

Measure:

- Can they sign up?
- Can they add prices?
- Can they paste a real message?
- Does the quote draft help?
- Do they understand confidence labels?
- Can they save a job?
- Can they export a quote or invoice?
- What do they not trust?

Next 10 Testers

Goal: confirm repeat usefulness across more contractor types.

Measure:

- Time saved per quote
- Number of quotes generated
- Number of saved jobs
- Export usage
- Price-list completeness
- User confusion points
- Willingness to pay

Business Value

SiteGent can create value by reducing the admin gap between customer message and professional quote.

For contractors:

- Faster quote preparation
- Less manual copying from WhatsApp
- Better saved job history
- More consistent quote and invoice format
- Company prices reused across jobs

For the business:

- Narrow, clear first product wedge
- Strong WhatsApp-first positioning
- Low-friction pilot

- Practical AI use case with human review
- Potential to expand into payments, WhatsApp sending, and lightweight operations only after quoting proves value

Risks and Assumptions

Product Risks

- Users may not add price lists fully enough.
- Users may expect the AI to be final instead of draft.
- Contractors may need trade-specific templates.
- Export formatting may need polishing for customer-facing use.

Technical Risks

- OpenAI costs must be controlled through authentication and rate limits.
- Supabase email confirmation settings can affect signup.
- Saved-job privacy must remain protected through RLS and API checks.
- Document export routes must stay reliable on Vercel.

Commercial Risks

- Users may like the demo but not pay.
- Some contractors may prefer WhatsApp-only automation rather than opening a web app.
- Different trades may require different pricing assumptions.

Roadmap

Next Week

- Manually test onboarding in a fresh Chrome profile.
- Invite 5 testers.
- Watch users add their first prices.
- Review 10 real pasted WhatsApp messages.
- Improve confusing copy only where users get stuck.
- Keep feedback collection simple.

Next Month

- Improve quote and invoice document polish.
- Add better example price-list guidance by trade.
- Add clearer empty states for users with no prices.
- Review OpenAI usage and cost.
- Improve support process for testers.

Next 3 Months

- Decide whether to add WhatsApp send/copy workflows.
- Add simple payment collection only if quote/invoice export is being used.
- Add team access only if companies ask for it.
- Build trade-specific quote templates only after clear demand.
- Prepare a paid pilot offer.

Acceptance Criteria for the Pilot Product

SiteGent is pilot-ready when:

- A new user can create an account.
- A user can create a company profile.
- A user can add or paste prices.
- A user can paste a WhatsApp job request.
- AI extraction returns useful job details.
- Quote lines are editable.
- Quote confidence is clear.
- User can save a job.
- User can export quote and invoice.
- A second company cannot see the first company's jobs.
- Users understand that all prices are drafts requiring review.

Final Product Principle

SiteGent should stay simple:

Paste WhatsApp message -> check quote -> save job -> export quote/invoice

Everything else should earn its place by helping a contractor quote faster.
